## 1. Understanding Tramadol

Tramadol is a **centrally acting opioid analgesic** primarily prescribed for:

- Moderate to moderately severe pain
- Post-surgical or chronic pain management
- Situations where non-opioid analgesics are insufficient

It works by binding to **opioid receptors** in the brain and spinal cord while also inhibiting the reuptake of **serotonin and norepinephrine**, which helps modulate pain. Due to its potential for dependency, misuse, and adverse reactions, **Tramadol is a controlled substance in many countries**, making proper medical evaluation essential before use.
